#### B.Sc. (ECS) (Part – III) (Semester – VI) (Old) Examination, 2017 COMPUTER SCIENCE Compiler Construction (Paper – IV)

Time: 2 Hours Total Marks: 50 Instructions: 1) All questions are compulsory. 2) Figures to the right indicate full marks. 10 Choose the correct alternatives. A bottom up parser generates a) Right most derivations b) Right most derivations in reverse c) Leftmost derivations d) Leftmost derivations in reverse 2) Which of the following is used for grouping of characters into tokens? a) Parser b) Code optimizer c) Code generator d) Scanner 3) In a syntax directed translation scheme, if values of an attribute of a node are a function of the attributes of its children, then attribute is called a) Canonical attribute b) Synthesized attribute c) Inherited attribute d) None of these 4) Concept which can be used to identify loops is \_ a) Dominators b) Reducible graphs c) Depth first ordering d) All of these P.T.O. **SLR-CZ - 62** -2-5) A compiler that runs on one machine and produces code for a different machine is called a) One pass compilation b) Two pass compilation c) Cross compilation d) None of these 6) A parse tree showing the values of attributes at each node is called b) Directed acyclic graph a) Derivation tree d) All of the above c) Annotated parse tree An important component of semantic analysis is \_ a) Code checking b) Type checking c) Flush checking d) All of the above 8) A memory allocates and deallocates storage as needed at runtime from data areas known as\_ a) Heap b) Stack c) Static d) All of these 9) Which of the following parser is most powerful? a) Operator precedence b) Canonical LR c) LALR d) SLR values of actual parameters are passed to caller procedu in call by value.

b) L

d) None of these

a) R

c) Both a and b

3. A) Attempt any two.

- 6
- Explain in details factors affecting pass structure of compiler.
- 2) What does the activation record? Explain field of it.
- 3) What is backtracking? Explain backtracking with example.
- B) Construct the predictive parsing table for the following grammar.

4

$$G = ( \{E, E', T, T', F\}, \{+, *, (,), id, num\}, P, E)$$

Where P:

$$E \rightarrow TE'$$
  
 $E' \rightarrow + TE' | \in$   
 $T \rightarrow FT'$   
 $T' \rightarrow *FT' | \in$   
 $F \rightarrow (E) | id | num$ 

4. Attempt any two.

10

- 1) Explain in details storage allocation strategies.
- 2) What is code optimization? Explain in details principal source of optimization.
- What is intermediate code generation? Explain types of three address code implementation of statements.
- 5. Attempt any two.

10

- What is bottom-up parser? Explain in detail shift reduce parsing using stack implementation.
- Construct annotated parse tree for the expression: 3 \* 5 + 4n using following production.

| Production              | Semantic rule              |
|-------------------------|----------------------------|
| $L \rightarrow E_n$     | print (E.val)              |
| E→E <sub>1</sub> +T     | $E.val := E_1.val + T.val$ |
| $E \rightarrow T$       | E.val : = T.val            |
| $T \rightarrow T_1 * F$ | T.val:T1.val * F.val       |
| T→F                     | T.val : = F.val            |
| F → (E)                 | F.val : = F.val            |
| F → digit               | F.val : = digit.lexval     |

3) Explain in details issue in the design of a code generator.

## B.Sc. (ECS) – III (Semester – VI) (New CGPA) Examination, 2017 COMPLIER CONSTRUCTION (Paper – IV)

Time: 2.30 Hours Total Marks: 70

Note: 1) All questions are compulsory.

2) Figures to the right indicate full marks.

b) Bottomup parser

d) None of these

a) Topdown parser

c) Both a and b

14 2. Answer the following (any 7): 1) Define Incremental Compiler. 2) Define Lexemes. 3) What is shift-reduce and reduce-reduce conflict? 4) What is need of semantic analysis? 5) Write the SDD for the following grammar. S->EN E->E+T|T T->T\*F F F-> digit | (E) N->; 6) What is Symbol Table? 7) Define Basic Blocks. 8) Explain Pre-Header. 9) Generate the Three address code for a following expression.  $X := a + b \cdot c + d$ ; 10 3. A) Answer the following (any 2): 1) Consider the CFG as, S->EN E->E+T E->E-T E->T T->T\*F T->T/F T-> F F->(E) F->digit

--- to-the input string 5+6+7:

-3-

**SLR-CZ - 56** 

N->:

2) Consider the following grammar,

S->aABe A->Abc|b B->d

Find the Handles for the String "abbcde".

- 3) Explain Activation Record in detail.
- B) Explain the concept of Input Buffering.

4

4. Answer the following (any 2):

14

1) Find out SLR parse table for the following grammar:

E->E+T|T

T->T\*F|F

F->(E) id

2) Construct the DAG for the following block.

a:=b\*c

d := b

e:=d\*c

b := e

f:=b+c

g:=f+d

3) Explain principle sources of optimization.

5. Answer the following (any 2):

14

 Write the following expression in syntax tree, postfix notation and Three address code of intermediate representations.

$$(a - b)^*(c+d) - (a+b)$$

- 2) Explain Peephole optimization.
- 3) Test whether following grammar is LL (1) or not.

## B.Sc. (ECS) – III (Semester – VI) (Old) Examination, 2017 COMPILER CONSTRUCTION (Paper– IV)

Day and Date :Friday, 3-11-2017 Max. Marks : 50

Time: 2.30 p.m. to 4.30 p.m.

a) Type checking

c) Both a and b

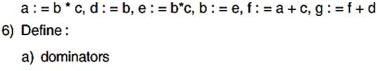

Instructions: 1) All questions are compulsory.
2) All questions carry equal marks.

| 2) All questions carry equal marks. |   |  |  |

b) Type analysis

d) None of these

| 2. | Solve any five :  | 10 |
|----|---|----|
|    | 1) Give the name of phases of compiler.                 |    |
|    | 2) Explain left factoring with example.                 |    |
|    | 3) Role of semantic analysis.                           |    |
|    | 4) Give the types of errors handled by syntax analyzer. |    |
|    | 5) Construct the DAG for the following blocks.          |    |
|    |   |    |

b) natural loops.

Set P

3- SLR-SZ - 57

3. A) Solve any two from following questions:

6

1) For the following grammar construct Syntax Directed Definition (SDD).

S-> EN E-> E + T | E - T | T T->T\*F | T/F | F F-> (E) | digit

N->:

- 2) What is runtime storage? Explain the runtime storage allocation in detail.
- 3) Explain compiler construction tools.
- B) Write the Intermediate Representation like syntax tree and three address code for the following expression.

(a-b)\*(c+d)-(a+b)

Solve following questions :

10

1) Check whether following grammar is LR(1) grammar or not.

S-> AaAb|BbBa, A-> ∈ B-> ∈

- 2) Why symbol table is used? Explain symbol table with its operation.
- What is three address code? Explain implementation of three address code statements.
- 5. Solve following questions:

10

1) Construct LL(1) parse table for following grammar:

S->aBDh B->cC C->bC|∈ D->EF E->g|∈ F->f|∈

- 2) Define Code optimization. Explain principle sources of code optimization.
- 3) Explain Activation Record. Draw the Activation Record for the factorial program.

# B.Sc. (E.C.S.) – III (Semester – VI) (CGPA Pattern) Examination, 2018 COMPUTER SCIENCE (Paper – IV) Compiler Construction

Day and Date: Tuesday, 3-4-2018 Max. Marks: 70

Time: 2.30 p.m. to 5.00 p.m.

Instructions: 1) All questions are compulsory.

2) Figures to the right indicate full marks.

1. Choose the correct alternative:

14

- 1) In compilers generation of intermediate code based on an abstract machine model is useful because
  - A) Syntax-directed translations can be written for intermediate code generation
  - B) To generate code for real machines directly from high-level language programs is not possible
  - C) Portability of the front end of the compiler is enhanced
  - D) Implementation of lexical and syntax analysis is easier
- 2) We have the grammar  $E \rightarrow E+n|E \times n|n$ . The handles in the right-sentential form of the reduction for a sentence  $n+n\times n$  are
  - A) n, n + n and  $n + n \times n$
  - B) n, E + n and  $E \times n$
  - C) n, E + n and E + E  $\times$  n
  - D) n, E + n and E + n  $\times$  n
- 3) The languages that need heap allocation in the runtime environment are
  - A) Those that use global variables
  - B) Those that use dynamic scoping
  - C) Those that support recursion
  - D) Those that allow dynamic data structure

P.T.O.

SLR-SC-57

-2-

- 4) In some programming language, L denotes the set of letters and D denotes the set of digits. An identifier is permitted to be a letter followed by any number of letters or digits. The expression that defines an identifier is
  - A) (L.D)\*
- B) (L + D)\*
- C) L(L.D)
- D) L (L + D)\*
- 5) Which one of the following statement is true?
  - A) Canonical LR parser is more powerful than LALR parser
  - B) SLR parser is more powerful than LALR
  - C) LALR parser is more powerful than canonical LR parser
  - SLR parser, canonical LR parser and LALR parser all have the same power
- 6) Consider the following C program:

int main (){/\*line1\*/

int i, n;/\*line 2\*/

for (i=0,i

While creating the object module, the compiler's response about Line No.

- A) Only syntax errorC) Only lexical error
- B) No compilation error
- D) Both lexical and syntax error

- 9) Which one of the following statements holds true for a bottom-up evaluation of syntax directed definition?
  - A) Inherited attributes can always be evaluated
  - B) Inherited attributes can never be evaluated
  - C) Inherited attributes can be evaluated only if the definition is L-attributed
  - Inherited attributes can be evaluated only if the definition has synthesized attributes
- 10) For predictive parsing, the grammar  $A \rightarrow AA \mid (A) \mid_{\in}$  is not suitable because
  - A) The grammar is right recursive
  - B) The grammar is left recursive
  - C) The grammar is ambiguous
  - D) The grammar is an operator grammar
- 11) Assuming that the input is scanned in left to right order, while parsing an input string the top-down parser use
  - A) Rightmost derivation
  - B) Leftmost derivation
  - C) Rightmost derivation that is traced out in reverse
  - D) Leftmost derivation that is traced out in reverse
- 12) \_\_\_\_\_ is a top-down parser.
  - A) Operator precedence parser
- B) An LALR (k) parser

C) An LR (k) parser

- D) Recursive descent parser
- 13) Why is the code optimizations are carried out on the intermediate code?
  - A) Because for optimization information from the front end cannot be used
  - B) Because program is more accurately analyzed on intermediate code than on machine code
  - C) Because for optimization information from data flow analysis cannot be used
  - D) Because they enhance the portability of the compiler to the other target processor
- 14) In a compiler, when is the keyboards of a language are recognized?
  - A) During the lexical analysis of a program
  - B) During parsing of the program
  - C) During the code generation
  - D) During the data flow analysis

- 2. Answer the following (any seven):
  - 1) List the phases that constitute the front end of a compiler.
  - 2) What is meant by Handle and Handle Pruning?
  - 3) Why lexical and syntax analyzers are separated out?
  - 4) What is operator precedence parser?
  - 5) What are the problems with top down parsing?
  - 6) What is phrase level error recovery?
  - 7) Mention the functions that are used in back-patching.
  - 8) What is a flow graph?
  - 9) What is code motion?
- 3. A) Answer the following (any two):

10

14

 Consider the following Context Free Grammar G = ( {S, A, B}, S, {a, b}, P) where P is

 $S \rightarrow AaAb$ 

 $S \rightarrow Bb$ 

 $A \rightarrow \epsilon$ 

B→∈

- a) Compute the FIRST sets for A, B and S.
- b) Compute the FOLLOW sets for A, B and S.
- c) Is the CFG G LL(1)? Justify?
- Define string. Give commonly used string related terms with example.
- 3) What are the types of Parser? Give some common programming errors with example which can occur at different levels.
- B) Consider the expression a + a \* (b c) + (b c) \* d.

4

- a) Draw the Syntax Tree.
- b) Draw the DAG.
- c) Give the postfix notation for same.
- d) Give the code sequence for the same.

Set P

4. Answer the following (any two):

14

SLR-SC-57

- 1) Explain an Activation Record.
- 2) Construct a table-based LL(1) predictive parser for the following grammar:

G = {bexpr, {bexpr, bterm, bfactor}, {not, or, and, (,), true, false}, P} with P given below.

bexpr → bexpr or bterm | bterm

bterm → bterm and bfactor | bfactor

bfactor → not bfactor | (bexpr) |true| false

For this grammar, answer the following questions:

- a) Remove left recursion from G.
- b) Left factor the resulting grammar in (a).
- c) Compute the FIRST and FOLLOW sets for non-terminals.
- d) Construct the LL parsing table.
- 3) Explain the primary structure preserving transformations and algebraic transformations on basic block with example.

#### 5. Answer the following (any two):

 What is Shift-Reduce Parsing? Consider the following grammar and input string. Parse the string using shift reduce parser. Show the content of the stack, input and action taken at each stage.

S → aB|bA

A → bAA|aS|a

B→aBB|bS|b

Input string: aabbab

- 2) Explain in detail Loops in Flow Graphs.
- 3) What are the various methods of implementing three address statements ?

|        |  |  |                               |
| CI D C | 56   |  |                               |
| SLR-S  | 70 52  | -2-  |                               |
| 7)     | A attribute a  | t a parse tree node  | is computed from attributes   |
|        | a) Inherited   | b) Synthesize  | ad                            |
|        | c) Both  | d) None  |                               |
| 8)     | Procedure calls and returns a  | A Company of the Comp | d by a run time stack called  |
| 0)     | the a) Heap  | b) Stack Allo  |                               |
|        | c) Control Stack   | d) None  | Cation                        |
| O)     | is the final p   | • ***  | r                             |
| 3)     |  | b) Run time  |                               |
|        | c) Both  | d) None  |                               |
| 10)    | A is a graphic   |  | of a program in which the     |
| 10)    | nodes of the graph are basic   | block and edges  | show flow.                    |
|        | a) Flow graph  | b) Loop  |                               |
|        | The Control Co | d) None  |                               |

11) Three address code is sequence of statements of Z = op Y.

13) By value is one type of parameter passing technique.

12) Code generator is not phase of compiler.

b) False

b) False

a) True

- 4) What is L-attributed definition ?5) Explain Stack Allocation.
- 6) What is the definition of Backpatching?
- 7) Explain flow graph.
- 8) What is copy propagation?
- 9) Explain left recursive.
- 3. A) Attempt any two of the following:

10

Explain Predictive parser. Construct the following grammar.

S → AB|€

A → aAB| €

 $B \rightarrow bA$ 

- 2) Write a note on Parameter passing.
- 3) Explain loops in flow graph with example.
- B) Explain Input Buffering.

4

4. Attempt any two of the following:

14

- 1) Explain phases of a compiler.
- Write a note on source language issues.
- Design and implementation of lexical analyzer explain with suitable example.
- 5. Attempt any two of the following:

14

- 1) Explain Run time storage management.
- What is Bottom-up parser? How to implement shift reduce parser? Solve the given example using Handle pruning.

$$S \rightarrow xPy$$

$$P \rightarrow xP|Qy$$

$$Q \rightarrow v$$

3) Explain construction of Syntax tree with example.

|    | A)   | Answer <b>any two</b> of the following the following that a superior of the following the following that the following the following that the following the following that the following the following that the following that the following th | owing :<br>ith example<br>e-address                            | statements used in the intermediate                                     |               |  |  |
| 3. | A)<br>B)   | Answer any two of the following the common thre languages.  3) When the lexical error   | owing :<br>ith example<br>e-address :<br>rs are occur          | statements used in the intermediate                                     | 6             |  |  |
| 3. | A)<br>B)<br>An   | Answer any two of the following the following that any two of the following the follow      | owing : ith example e-address : es are occur ng :              | statements used in the intermediate                                     | 4             |  |  |
| 3. | <ul><li>A)</li><li>B)</li><li>An</li><li>1)</li></ul>            | Answer any two of the following the common thre languages.  3) When the lexical error Explain backpatching.  swer any two of the following Discuss phases of compilers.   | owing: ith example e-address: s are occur ing: er.             | e.<br>statements used in the intermediate<br>rred ? How to recover it ? | 4             |  |  |
| 3. | <ul><li>A)</li><li>B)</li><li>An</li><li>1)</li><li>2)</li></ul> | Answer any two of the following the common thre languages.  3) When the lexical error explain backpatching.  swer any two of the following biscuss phases of compile explain inherited attribute  | owing: ith example e-address: s are occur ing: er. on the pars | e.<br>statements used in the intermediate<br>rred ? How to recover it ? | 4             |  |  |

2) Explain inherited attribute on the parse stack with 6
3) What is left recursion? How to eliminate it? Explains.
5. Answer any two of the following:

Discuss an activation record.
Explain an issues in the design of code generator.
Consider the grammar,
stmt → if expr then stmt
if expr then stmt clse stmt
other
where 'other' stands for any other statement.

check whether the given grammar is ambiguous or not; if found ambiguous, remove the ambiguity and write the equivalent unambiguous grammar.

| <ol> <li>Back patching is a technique for generating code for expres<br/>and statements in one pass.</li> </ol>                      |                                       |   |  |                               |    |
|  | a) boolean                            | b) arithmetic   | c) logical   | d) none                       |    |

2. Answer any five of the following:

10

- 1) List out the some useful compiler construction tools.
- 2) What is the difference between panic mode recovery and phrase-level recovery?
- 3) Give several methods for evaluating semantic rules.
- 4) What is control stack?
- 5) What is the role of lexical analyzer?
- 6) Define:
  - a) Basic block
- b) Flow graph
- 3. A) Answer any two of the following:

6

- 1) Explain dominator and immediate dominator with example.
- 2) Define the following with example
  - 1) Token
  - 2) Pattern
  - 3) Lexeme
- 3) Explain Boolean expression.
- B) What is three address code?

4

Consider, the expression

$$a := b \cdot - c + b \cdot - c$$

Give the code for syntax tree and code for dag of expression.

-3-

SLR-0 - 64

4. Answer any two of the following:

10

What is dag? Construct the dag for the expression

$$x - x * (y + z) - (y + z) * w$$

Also give the instructions for the same.

- 2) Define compiler. Explain the different types of compiler.
- 3) Consider the expression,

$$E \rightarrow E + E/E * E/id$$

check whether the above grammar is ambiguous or not; if found ambiguous, remove the ambiguity and write an equivalent unambiguous grammar.

Answer any two of the following:

10

- 1) Explain structure-preserving transformation basic block.
- 2) Give the different storage-allocation strategies. Explain any two.
- 3) Explain the notational conventions with regard to grammar.
